ABSTRACT

AN APPARATUS AND METHOD FOR VERY HIGH DATA RATE OPTICAL TRANSMISSION, AND THE USE OF SAID APPARATUS AND SAID METHOD

The invention relates to an apparatus for transmitting a signal through an optical data transmission network, the apparatus comprising a pulse emitter (10) and at least one line fiber (12) for conveying at least one pulse (30) in said line fiber. The apparatus further comprises a spreader module (14) for linearly spreading pulses, said spreader module comprising a propagation medium that is dispersive and linear, said propagation medium presenting accumulated chromatic dispersion that is high enough to lower the peak power (P_c) of the pulse to below a predetermined threshold (S), where a signal above said threshold is liable to be subjected to non-linear distortion in the line fiber, said spreader module (14) being disposed between the emitter (10) and the line fiber (12).
